INTRODUCTION
The city of Flint, Michigan is home to about 100,000 people and is located in Mid-Michigan along the Flint River. For a long time, car factories in Flint were a major source of money and jobs for the community. When car factories began to close, the city shrank and communities suffered with less money. In 2014, the local government in Flint tried to save money and decided to stop buying water from a nearby city, Detroit. Detroit got their water from Lake Huron, but Flint decided to start taking water from the Flint River instead. In less than 2 months after switching to river water, people started getting sick from using and drinking the new water because of bacteria and lead. The government tried to hide the problems at first, so the actions to improve the crisis were not done in time. In the months and years after the switch, many people in Flint were harmed by the water and many are still suffering the effects, even after switching back to Lake Huron water. Over half of Flint’s residents are Black and many are living in poverty, so this crisis shows the severe effects of inequality and systemic racism. The effects are long lasting and include more than just physical health. The city is still working to heal their minds and bodies, and rebuild the city’s name in a positive way.

KEY VOCABULARY
- community
- contamination
- corrosive
- inequality
- lead poisoning
- public health crisis
- systemic racism
